AI Automation Intern – Assessment Instructions

Objective

We are looking for candidates who can use AI to solve real business problems and build practical, usable systems.

This assessment is designed to evaluate:

- Problem-solving ability
- Practical execution
- System thinking
- Use of AI tools in real scenarios

Instructions

- Choose ANY ONE of the problem statements below
- Build a working solution (MVP level)
- Focus on clarity, practicality, and execution
- You may use AI tools, APIs, no-code tools, or code

What We Mean by "System"

Your solution should:

- Take inputs
- Process them logically
- Generate structured outputs

It can be:

- Fully automated (preferred)
- Semi-automated
- Structured workflow (acceptable)

We are evaluating how you think and solve, not the complexity of tools.

Input Assumptions

If sample data is not provided, you may:

- Use publicly available examples
- Create your own sample dataset
- Keep inputs realistic and relevant

Recommended scale:

- 5–10 resumes
- 1 job description
- 1 SOP document

Timeline

- Submit your solution within 48 hours of receiving this assignment

Submission Process

Submit your solution using the form link provided in the email.

Include the following:

- Your email address (auto-captured)
- Selected problem
- Solution link (Drive / Sheet / Doc / Repo)
- Short explanation of approach (max 200–300 words)
- Tools used
- Optional demo video

⚠️ Ensure all links are accessible (Anyone with link can view)

What Counts as a “Solution”

Your submission should include:

- A working output (Sheet / Doc / Tool / Workflow)
- Clear logic or process
- Results generated from sample input

Expected Effort

- 3–6 hours of focused work is sufficient
- Do not overbuild

Problem Statements (Choose ONE)

◆ Problem 1: AI Resume Screening System

Scenario:

You receive multiple resumes for a role and need to shortlist candidates efficiently.

Task:

Build a system that:

Inputs:

- Job Description (JD)
- Multiple resumes

Outputs:

- Match score (0–100)
- Candidate ranking
- Key strengths (2–3 points)
- Key gaps (2–3 points)
- Final recommendation:
- Strong Fit / Moderate Fit / Not Fit

Example Output (for reference):

Candidate	Score	Strengths	Gaps	Recommendation
A	82	Strong SQL, Analytics	Weak Python	Strong Fit

◆ Problem 2: Interview Scheduling Automation

Scenario:

Interview scheduling involves multiple back-and-forth emails.

Task:

Build a system that:

Inputs:

- Candidate availability
  (Example: Tue–Thu 2–5 PM, Fri 9 AM–12 PM)
- Interviewer availability (3–5 interviewers)

Outputs:

- Top 3 suggested interview time slots
- Conflict resolution (if any overlaps)
- Final recommendation with reasoning

Example:

- Candidate: Tue 2–5 PM
- Interviewer A: Tue 3–6 PM
- Interviewer B: Tue 1–4 PM

→ Suggested slot: Tue 3–4 PM

🔹 Problem 3: Hiring Funnel Dashboard

Scenario:

Management lacks visibility into hiring performance.

Task:

Create a dashboard (use sample/mock data if required) showing:

- Total applicants
- Stage-wise conversion rates
- Time to hire
- Drop-off points in funnel

🔹 Problem 4 (Optional – Advanced): SOP → AI Training System

Scenario:

Training employees using SOP documents is manual and time-consuming.

Task (Core - Required):

Build a system that:

Input:

- SOP document (text/PDF)

Outputs:

- Structured summary (main points)
- Step-by-step training content
- 3–5 evaluation/quiz questions

SOP Input:

You may:

- Use any real or sample SOP
- Keep it simple (1–2 pages)

Bonus (Optional - Advanced):

- Convert output to presentation format (slides or video)
- Add automation workflow
- Create demo interface

Tools You Can Use

You may use any of the following:

- ChatGPT / Claude / LLMs
- Python / scripting
- No-code tools (Zapier, Make, etc.)
- Google Sheets / Docs / Power BI
- APIs and integrations

Tool Choice

We evaluate how you solve the problem, not the tool used.

Evaluation Criteria

Criteria	Weight
Problem Understanding	20%
Practical Execution	30%
Output Quality	25%
Simplicity & Clarity	15%
Creativity	10%

Important Notes

- Do NOT over-engineer
- Do NOT focus on theory
- Focus on building something usable and practical
- We evaluate thinking + execution, not just output

Avoid

- Submitting only ChatGPT-generated answers
- Overly theoretical explanations
- No working output

Bonus (Optional)

- Add automation
- Build a simple interface (UI / dashboard)
- Suggest improvements to hiring or training process

Tip

Approach this as a real-world problem:

> "If I had to deploy this in a company tomorrow, what would I build?"

We look forward to your submission.
